The Virtual Filesystem - A

Objective: In this lab modify the "sleepkiller" you made in Lab5 to locate a sleep process and navigate the process filesystem to print the current directory of where it was instantiated.

File(s) for this lab:

```
init_module() called
Found sleep process, getting cwd ...
sleep_killer: current working directory [Lab13]
Found sleep process, getting cwd ...
sleep_killer: current working directory [tmp]
```

1. Examine the "struct task_struct" for a filesystem information structure, follow that until you arrive at the current directory reference. Use slides for reference.
